MINI PROJECT DOCUMENTATION

Skill2Earn AI

Learn Skills, Earn Income

Project Title	Skill2Earn AI — Learn Skills, Earn Income
Development Tool	Base44 AI App Builder
Project Type	AI-assisted web application / mini project
Live Project	https://subtle-skill-grow-gain.base44.app/
Documentation Date	October 2026

Project Overview

Skill2Earn AI is a web-based project concept focused on helping people connect skill development with potential income opportunities. The idea is to make learning more practical by guiding users toward useful skills and ways those skills may be applied to freelance work, small projects, or entry-level opportunities.

Prepared as a concise academic mini-project report for sharing with a GitHub repository.

Live demo: Open Skill2Earn AI

Documentation Note

This report is based on the supplied project title and live URL. The live application's complete screens, database schema, and feature set were not independently verified while preparing this document. Therefore, the modules and workflows below describe the intended project concept and should be adjusted if the implemented website behaves differently. Do not present proposed features as completed functionality unless they are present in the live app.

1. Abstract

Skill2Earn AI — Learn Skills, Earn Income is an AI-assisted web application concept designed to encourage users to develop practical skills and explore ways to use those skills to earn income. The platform aims to bridge the gap between learning and application by organizing skill discovery, learning guidance, and potential earning paths in one accessible web experience. The project was created using Base44, an AI app-building platform that can generate application interfaces and workflows from natural-language instructions. The project demonstrates how AI-assisted development can help turn an idea into a shareable web application.

2. Introduction

Digital skills are increasingly useful for education, employment, freelancing, and entrepreneurship. Beginners may struggle to decide which skills to learn, how to practise them, and how to identify realistic ways to apply them. Skill2Earn AI is intended to provide a simple starting point for connecting skill learning with practical outcomes. Its web-based format allows users to access the project through a browser without installing a desktop application.

3. Problem Statement

Many learners find it difficult to connect online learning with real-world earning possibilities. Learning resources and work opportunities may be scattered across different platforms, making it harder for beginners to plan their next steps. This project explores a single, approachable experience that helps users think about what to learn,

how to practise, and how a skill might be applied to an income-generating activity.

4. Objectives

- Provide a clear, beginner-friendly web experience around learning skills and exploring income paths.
- Help users identify practical skills that may match their interests and goals.
- Present learning and practice as steps toward applying a skill in real tasks.
- Demonstrate the use of an AI app builder to develop and publish a web-based mini project.
- Create a project that can be shared through a public demo link and documented in GitHub.

5. Scope of the Project

The project focuses on the learning-to-earning concept and a web-based user experience. Depending on the features actually implemented in the Base44 application, the scope may include skill discovery, learning recommendations, practice suggestions, and examples of ways to apply a skill. It should not be treated as a job-placement service or a guarantee of income. Users should evaluate opportunities carefully and avoid paying unknown parties to obtain work.

6. Tools and Technologies

Tool / Technology	Purpose
Base44 AI App Builder	Primary platform used to create and publish the web application using natural-language instructions and iterative refinement.
Web browser	Used to access, review, and test the live application.
GitHub	Recommended for project documentation, version history, and sharing exported source code if available.
Internet connection	Required to access the hosted app and online development tools.

7. Proposed System and Modules

The following are conceptual modules for a Skill2Earn-style application. Retain only the modules that match the current live project.

7.1 Home / Introduction

Introduces the purpose of the platform and explains the relationship between learning useful skills and exploring ways to apply them.

7.2 Skill Discovery

May help users browse or identify skill areas such as communication, design, programming, content creation, digital marketing, or data handling. The final categories should reflect the live application.

7.3 Learning Guidance

May present a suggested learning path, beginner practice tasks, or milestones to help a learner build confidence and demonstrate progress.

7.4 Earning Path Exploration

May explain how a skill could be applied through freelance services, portfolio projects, internships, small business tasks, or entry-level roles. These are possibilities, not promises of employment or income.

7.5 User Interaction

Depending on implementation, users may interact with forms, buttons, selection controls, or personalized recommendations. Document the actual inputs and outputs after testing the live app.

8. System Workflow

1. The user opens the Skill2Earn AI website in a browser.
2. The user reviews the platform's purpose and available options.
3. If the feature is implemented, the user selects a skill, interest, or goal.
4. The application presents relevant information or guidance based on the available functionality.
5. The user reviews learning steps and possible ways to apply the skill.
6. The user practises independently and evaluates opportunities carefully.

9. Development Methodology Using Base44

Base44 is an AI app-building platform that allows users to describe an application in natural language, generate an initial app, refine the interface and workflows, and publish a web experience. The exact implementation of Skill2Earn AI should be described using the steps actually followed during development.

1. Requirement definition: decide the audience, problem, main goal, and essential pages.
2. Prompting: describe the desired Skill2Earn AI interface and user journey to Base44 in clear, specific language.
3. AI-assisted generation: review the generated pages and app behaviour.
4. Iteration: request changes to layout, content, validation, and navigation as needed.
5. Testing: open the published app and test each visible link, form, and interaction.
6. Publishing: use Base44's publishing workflow to make the app accessible through its live URL.
7. Documentation: prepare a README and this report, and store project documentation in GitHub.

10. Testing and Evaluation

Testing should be performed on the actual published application. Mark each item only after checking it.

Test Case	What to Check	Status
Website access	The published URL opens without an unexpected error.	To be tested
Navigation	Visible navigation links and buttons lead to the correct page or section.	To be tested
Forms / inputs	Inputs accept valid information and display helpful feedback for invalid or missing entries.	If applicable
Core workflow	The main user journey can be completed from start to finish.	To be tested
Responsive layout	Pages remain readable on desktop and mobile-sized screens.	To be tested
Content accuracy	Skill guidance and earning-related content is understandable and does not promise guaranteed income.	To be tested

11. Advantages and Limitations

Advantages

- AI-assisted creation can reduce the time needed to produce an initial application.
- The web-based project can be accessed through a shareable URL.
- The concept encourages practical learning and thinking about how skills can be applied.
- The project can be iteratively improved based on user feedback.

Limitations

- The available functionality depends on what has actually been configured in Base44.
- Recommendations may need human review and should not be treated as guaranteed career or financial outcomes.
- The app may depend on Base44 hosting, platform services, and plan-specific capabilities.
- A public demo URL does not by itself prove that source code, database records, or configuration are included in a GitHub repository.

12. Future Enhancements

- Add a learner profile with interests, current skills, and goals, if appropriate.
- Provide structured learning paths with milestones and practice tasks.
- Allow users to save completed tasks or track progress.
- Include portfolio-building guidance and examples of beginner projects.
- Add carefully reviewed opportunity resources and scam-awareness guidance.
- Collect feedback and improve usability based on actual user testing.
- Export the source code and maintain version history in GitHub, where supported by the Base44 plan.

13. Conclusion

Skill2Earn AI — Learn Skills, Earn Income explores how a web application can help connect skill development with practical opportunities to apply those skills. Using Base44 as an AI-assisted development tool provides a way to build and publish the application through an iterative, prompt-driven workflow. The project can be extended through testing, user feedback, clearer learning paths, and responsible earning guidance. The final report should be kept aligned with the features that are genuinely available in the deployed app.
